Danish Glostrup Hospital decides for SOMNOmedics SOMNOscreen™ plus

The internationally renowned Glostrup Hospital near Copenhagen in Denmark has decided for SOMNOmedics devices as the new equipment of the departments for ambulatory screenings and polygraphy in the Danish Sleep Center for Sleep Medicine. It is a total of 15 devices, there of ten SOMNOscreen™ plus PSG+ for extended screenings and full polysomnographies as well as five SOMNOscreen™ plus RC easy for cardiorespiratory screenings.

The Glostrup Hospital is known as a regional and national center for medical health care. The local Danish Center for Sleep Medicine is the most important and biggest department for sleep medicine in Denmark.

Prof. Poul Jennum mainly decided for the devices because of the versatility and the modularity of the systems: The SOMNOscreen™ can be used individually as a cardiorespiratory screener, a full PSG or a EEG device. Thanks to its portability it can even be used very flexible and location-independent in the whole hospital.

The built-in option for long term blood pressure measurement was also a reason and a unique selling proposition that decided for the SOMNOscreen™ systems since the systolic and diastolic blood pressure can be measured here continuously without a cuff using the PTT thanks to a patented algorithm.
